Problem statement: What is the problem?

Pitch: Why should people buy or listen to the app/idea?

 Benefit: How will this benefit the AI community?

Because they lack the human knowledge and comprehension that comes with using a genuine assistant, many virtual assistants, like Siri and Alexa, are extremely difficult to understand and extremely complicated. This is because they lack the human knowledge and comprehension that comes with using a genuine assistant. This is due to the fact that they do not possess the human understanding and knowledge that comes with employing an actual helper. This is because they do not have the human understanding and wisdom that comes with employing a real assistant. The reason for this is that they do not have a genuine helper. One of the obstacles posed by the current circumstances is the fact that they are attracting an ever-increasing number of adherents to their cause.

We developed a virtual assistant named Marr and a chat bot support incase of any incident. The software searches across different sources such as google and key words based on the specific key phrases and terms that are included in a command.The input will serve as the basis for this search. During this step of the process, it acquires information about the user by adopting a number of different modes of data entry, including voice recognition and manual entry. For example, it may recognize the user's voice as it enters their information. The chatbot uses buttons and pre set sollutions that will allow a user to be able to solve their problem in a matter of minutes. If the issues continue the user will be directly connected to a human employee to hopefully help resolve the situation. The chatbot also allows users to report bugs to help improve the performance of the virtual assistant.

Those who work in the subject of artificial intelligence (AI) will find this to be beneficial because it incorporates such a wide variety of programs and designs coming from a large number of different sources. Because of this, a wide variety of programmers are given the opportunity to seek advice and ideas from one another with the goal of developing their respective apps, which will, in the end, be to the benefit of the AI community as a whole. This can be achieved by giving users access to a strong chatbot or virtual assistant that is able to respond to questions posed in any language that the user chooses to utilize. This helps to contribute to the expansion of the community of people who are working on the development of artificial intelligence. It also helps to contribute to the extension of the community. In addition to this, it is useful in that it contributes to the growth of the community.
